FINAL YEAR PROJECT

Argus

A guarded AI analyst that answers business questions from data, in plain English

The problem, and our idea

The problem

Data needs SQL

Company data sits in databases, and getting answers out needs SQL, a special database language.

People have to wait

Most managers don't know SQL, so even simple questions wait days for a data analyst.

AI alone isn't safe

AI can write SQL, but it sometimes guesses wrong, or writes a query that could damage the data.

Our idea

- Ask in plain English, the way you would ask a colleague.
- AI writes the SQL, and the app checks it before it runs.
- The answer comes back as a chart or a number, with the SQL shown so anyone can check it.

EXAMPLE

“Which product categories earned the most money?”

Answered in about a second, from 99,441 real orders

How it works

1

Ask

Type a question in plain English.

2

Write

AI turns it into a SQL query.

3

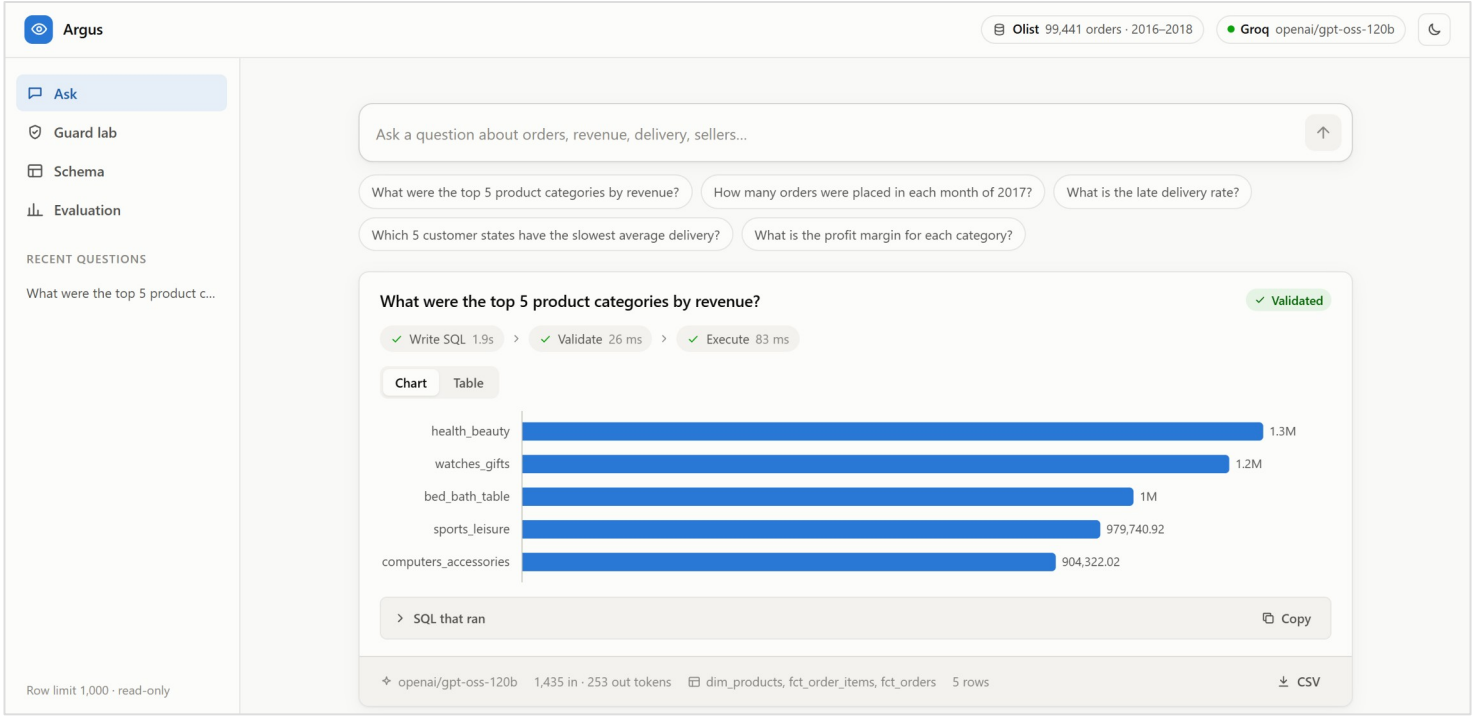

Check

The guard blocks anything unsafe.

4

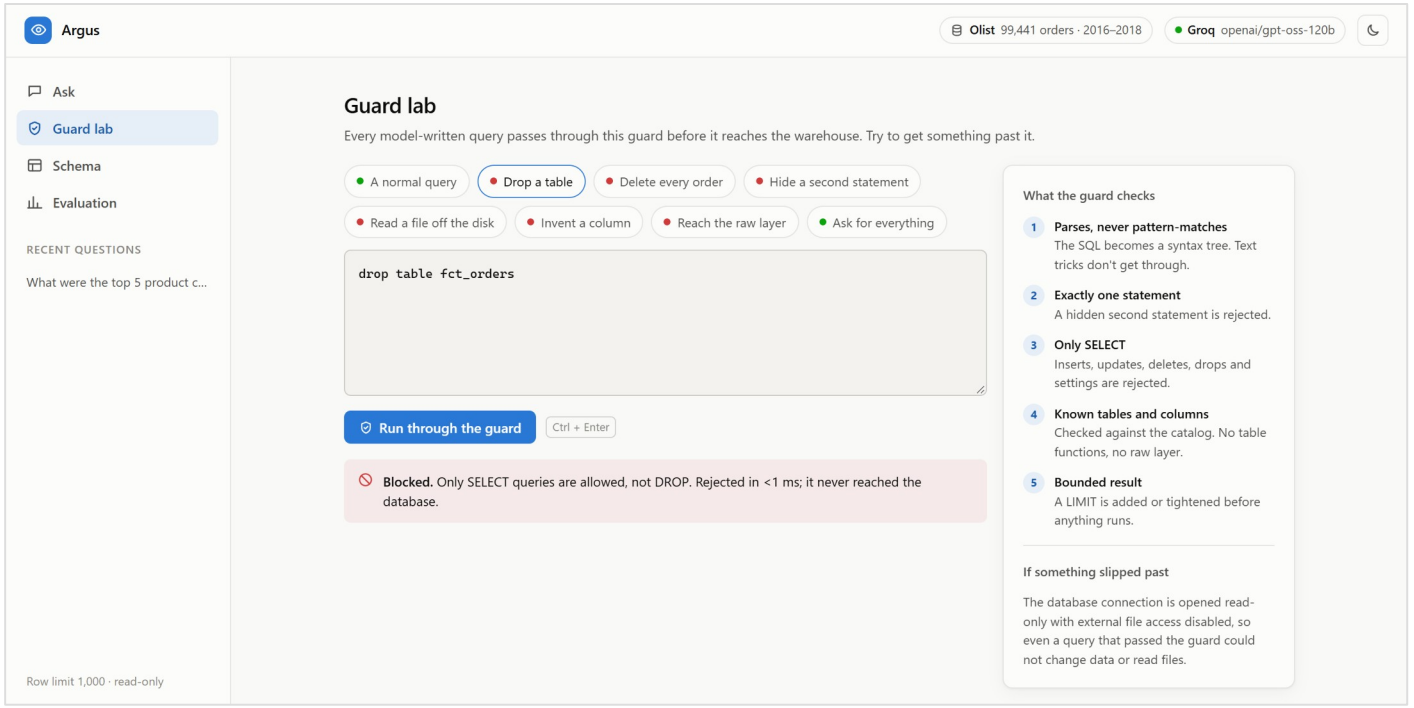

Answer

Get a chart or table, plus the SQL.

The live app answering a real question. Each step shows how long it took.

Safe and honest by design

Guard lab: a query that tries to delete a table is stopped before it reaches the data.

Checks every query

Every query is read before it runs. Anything that deletes, changes or reaches outside the data is stopped.

Says no instead of guessing

If the data can't answer, like profit when there is no cost data, the app says so instead of making up a number.

Same rules every time

Words like “revenue” have one fixed formula, so answers stay consistent every time.

Results on real data

Tested like an exam: 22 questions with known answers, on 99,441 real orders from a Brazilian online store.

20/20
Regular questions answered correctly

2/2
Impossible questions correctly refused

100%
Queries ran without errors

1.3s
Typical time to answer

What the testing caught

While building, the tests found two mistakes: a test question that had two right answers, and an instruction that confused the AI. Both were fixed, and the tests now check for them.

What comes next

- Grow the test to 200 harder questions; 22 is still an easy test.
- Let the app ask back when a question is unclear.
- Put the app online so anyone can try it.

Thank you

Questions are welcome
